

## **ABSTRACT OF THE DISCLOSURE**

Disclosed is an improved disk recording-and-reproducing device including a box-like casing and a lid hinged to the casing to rotate about its pivot for opening and closing the casing. The lid has a disk holder and a swingable L-shaped lever both fixed to its rear side. The swingable lever has its upper flat shelf to support a disk when inserted in the disk holder. Also, it has a rubber boss fixed to its lower end, thereby making the lever stand upright in parallel with the rear side of the lid when the disk is opened. On the other hand, the casing has a counter projection formed in confronting relation with the lower end of the lever, thus making it swing about its pivot apart from the lower end of the disk holder when the lid shuts.
